

GLAM HOMES AI CALL CENTER

Engineering Report, Live Front-End Audit, Analytics Guide

Based on glamhomes.aipeople.app live screenshots, deployed HTML, local runtime code, and data validation

Executive thesis

GLAM HOMES is not a chatbot. It is a controlled call-center operating system: live voice, PMS truth, SMS actions, human handoff and analytics.

Live product screenshot: voice console and operations monitor

Table of contents

Section	Pages	What it covers
Executive diagnosis	3-9	Problem, solution, value equation, operating model.
Live front-end audit	10-31	Screenshots and module-by-module explanation of glamhomes.aipeople.app.
Analytics operating guide	32-45	Every KPI, priority card, chart, table, filter and decision trigger.
Architecture and runtime	46-55	OpenAI Realtime, Twilio, Guesty, SQLite, transcripts, knowledge base.
Governance and rollout	56-64	Security, deployment gap, operating cadence, risks, roadmap.
Appendix	65-70	Evidence inventory, validation, file map and acceptance criteria.

Reading guide

This is written as a board-ready engineering deck: business problem first, evidence next, then operational mechanics and implementation detail.

Executive answer - what GLAM HOMES solves

Question	Answer
What is the product?	A live AI call-center console for luxury vacation rentals, combining voice, Guesty data, Twilio calls/SMS, protected analytics and human escalation.
What pain does it remove?	It reduces missed calls, repetitive guest support, manual property-link routing, unsafe static answers and unmanaged escalation.
Why is it not a generic bot?	The agent is tool-grounded. It retrieves live reservation/listing data and sends SMS through controlled Twilio functions.
Why does management care?	The dashboard turns conversations into measurable operational signals: volume, prospects, handoffs, repeat contacts, issues, SMS and transcript quality.
Why does Orbit care?	It is a reusable pattern for vertical AI tools with live APIs, protected data, and measurable operations.

Bottom line

The project is strongest when described as an operating system for hospitality calls, not as a front-end demo.

Problem definition - the broken workflow before AI

Operational pain	Why it hurts	What the system now does
Booking calls arrive fragmented	Prospects ask about homes, dates, prices and fit across voice and SMS.	The concierge qualifies intent and can send public property links.
Stay details are sensitive	Door codes, Wi-Fi, address and check-in cannot be guessed.	Guesty tools require reservation validation before sensitive details.
Human exceptions are common	Refunds, parties, VIP requests, complaints and maintenance need judgment.	Handoff SMS and live transfer move risky cases to people.
Managers lack visibility	Call logs alone do not explain what callers asked or why escalation happened.	Protected analytics and threaded transcripts create an audit trail.
Knowledge is trapped in history	Thousands of Guesty conversations contain repeated patterns.	24,072 cases are distilled into use cases and best practices.

Solution model - one operating layer

- Voice captures intent in real time and lets guests interact naturally.
- OpenAI Realtime chooses tools instead of relying on static memory.
- Guesty remains the source of truth for reservations, listings, availability and stay details.
- SQLite gives fast access to public property links for sales routing.
- Twilio synchronizes phone calls, SMS follow-up, advisor alerts and transfer.
- Analytics converts transcript events into management signals.
- Historical conversations become policy and coaching material, not raw prompt bloat.

Design principle

Autonomy is useful only when it is bounded: read live facts, take low-risk actions, escalate judgment calls.

Strategic value equation

Value lever	Mechanism	Expected business effect
Revenue capture	Prospect detection, property search, property-link SMS.	Fewer lost booking opportunities.
Service quality	Reservation confirmation and stay-detail retrieval.	Fewer incorrect or incomplete answers.
Risk control	Read-only Guesty, validation gates, policy escalation.	Lower probability of costly mistakes.
Operating leverage	Routine voice/SMS workflows handled by agent.	Humans focus on exceptions and high-value guests.
Learning loop	Analytics + 24,072 case knowledge base.	Repeated issues become process improvements.

What makes this engineering-grade

Dimension	Evidence observed	Why it matters
Live deployment	glamhomes.aipeople.app loads, Twilio public health returns HTTP 200.	Not only local code.
Operational UI	Voice, Analytics, Calls and Security modules are present.	Supports human operation.
Protected data	Analytics, calls and security are locked behind dashboard access.	Phone and transcript data are treated as sensitive.
Live tool layer	Guesty and Twilio functions are registered as runtime tools.	Agent can act on systems of truth.
Knowledge base	24,072 JSONL cases, 0 invalid rows.	Historical learning is structured.
Export hygiene	Private data is kept under ignored local paths.	Reusable without leaking secrets.

Audited facts used in this report

Evidence source	What was inspected	Result
Live browser	https://glamhomes.aipeople.app	Loaded with live status, modules and protected dashboards.
Live screenshots	Desktop and mobile module captures.	Saved under orbit-aipeople/reports/live-screenshots.
Live HTML	Downloaded deployed index.html.	157,478 bytes; includes Analytics and Calls as separate tabs.
Local code	apps/voice-agent/server.py and public/index.html.	Runtime tools, endpoints and local UI reviewed.
Data checks	SQLite, JSON exports, case_index.jsonl.	Integrity and counts validated.

Important finding

The live front end is ahead of the local checked file in some analytics UI details; the report calls this out rather than hiding it.

Live site - voice console

Live viewport capture from glamhomes.aipeople.app

What this proves

- Shows public production surface.
- Voice and SMS services are active.
- Twilio monitor reports backend, media bridge, proxy, webhook and provider status.
- Guesty note confirms read-only credentials detected.

Voice console - module anatomy

Area	What it does	Engineering meaning
Agent stage	Shows concierge avatar, state, microphone visualization and live marker.	Human-readable call state for operators.
Voice actions	Start voice, Test voice, End session.	Controls WebRTC/Realtime browser session.
Voice engine	Standard OpenAI/Twilio voices plus Vapi option.	Provider abstraction for call voice.
Voice lock	Dashboard unlock required to change call voice.	Admin control separated from guest-facing testing.
Microphone panel	Device selection, test button, audio level.	Reduces setup failure before live calls.
Side notes	Local mode, scope, Guesty, brand.	Explains runtime boundaries to operators.

Realtime console and manual composer

Element	Observed behavior	Why it exists
Session title	GLAM HOMES Session with GH timestamp label.	Creates session identity for live testing.
Chat feed	System messages and future transcript turns.	Operator can see what the agent says and does.
Composer	Manual instruction textarea and Send button.	Allows typed testing without a phone call.
Status copy	Explains local WebRTC and OPENAI_API_KEY dependency.	Makes configuration failures visible.
Twilio preparation message	Shows line and webhook readiness context.	Connects browser test to telephony deployment.

Twilio operations monitor - what each line means

Monitor item	Meaning	Operational action
Voice service	Whether the voice path is available.	If down, do not route live calls.
SMS service	Whether SMS delivery is available.	If down, avoid promising text follow-up.
Backend API	Local app process readiness.	Restart server if failed.
Media bridge	Twilio audio stream bridge.	Check port/process for voice failures.
Public proxy	Public tunnel/proxy health.	Verify Cloudflare/public route.
Public Twilio health	HTTP health endpoint from deployed URL.	Confirms Twilio can reach the app.
Voice/SMS webhook	Twilio number callback configuration.	Fix number config if mismatch.
Voice provider network	API provider latency.	Watch for call quality risk.

Live site - analytics lock

Analytics module from deployed site

What this proves

- Analytics is intentionally protected.
- The deployed module includes KPIs, priority cards, charts and operational tables behind the lock.
- This protects phone, transcript and customer issue history.

Analytics module - live front-end anatomy

Part	Live deployed front end	Purpose
Lock screen	Analytics Locked + dashboard password.	Protects private operational metrics.
Range filters	Today, 7 days, 30 days, All, Custom.	Controls all KPI/chart scopes.
KPI grid	12 management KPIs in deployed HTML.	Management scorecard.
Secondary metrics	10 supporting metrics.	Operational diagnostics.
Priority grid	Priority queue, Repeat issue, VIP pipeline, Quality signal.	Tells managers what to review first.
Charts	Topics, Pipeline mix, Calls by day/hour.	Volume, mix and timing patterns.
Tables	Subtopics/repeats and escalations by reason.	Root-cause and handoff analysis.
Frequent concepts	Top issue chips.	Fast pattern discovery.

Live Analytics KPIs - full scorecard

KPI	Definition	Use
Total calls	Calls in selected scope.	Workload denominator.
Prospects	Calls with booking intent.	Revenue opportunity.
Transcript coverage	Calls with transcript evidence.	Observability health.
Human handoffs	Escalation events.	Human workload and risk.
First call resolution	Eligible calls resolved on first contact.	Service effectiveness.
Avg resolution	Start-to-end or transfer duration.	Speed and friction.
Repeat contact	Repeat callers and same-subtopic repeats.	Unresolved issue detection.
Issues detected	Total issue signals and multi-issue calls.	Complexity load.
Influencers	VIP/influencer callers flagged.	High-touch sales/service routing.
Needs attention	Calls marked for review, with praise count.	Quality queue.
Missed/abandoned	Telephony status and short unresolved calls.	Lost-contact risk.
SMS sent	Guest/advisor SMS actions.	Channel follow-through.

Priority cards - management triage

Card	What it measures	Decision trigger
Priority queue	Attention calls needing review.	Open red conversations first.
Repeat issue	Same-subtopic callbacks.	Fix underlying workflow/property issue.
VIP pipeline	Influencer/VIP signals and unique callers.	Route to premium human process.
Quality signal	Praise calls and positive guest sentiment.	Identify scripts and behaviors to preserve.

How to use

This row is the daily manager shortcut: what needs review, what keeps repeating, who needs VIP handling, and where the agent performed well.

Charts - how to read them

Chart	Meaning	Management action
Topics by call volume	Counts topic hits by transcript category.	Prioritize scripts and property data for the tallest bars.
Pipeline mix	Prospects, support, handoffs and other share.	Understand whether the line is sales-heavy or support-heavy.
Calls by day and hour	Bubble heatmap of call timing.	Staff coverage and campaign timing decisions.
Subtopics and repeats	Operational root causes and repeat counts.	Find unresolved loops.
Escalations by reason	Handoff reasons by category.	Improve policy, staffing, data or maintenance playbooks.
Frequent concepts	Top chips from subtopics and topics.	Fast discovery of recurring issues.

Analytics filters and interpretation rules

Filter	What it does	Correct use
Today	Same-day view.	Operational standup and live triage.
7 days	Default recent operating window.	Weekly review and staffing.
30 days	Monthly trend read.	Management reporting.
All	Historical baseline.	Benchmarking and audits.
Custom	Exact incident/campaign/shift window.	Postmortems and launch analysis.
Phone	Caller-specific search in Calls module.	Follow-up and dispute review.
Keyword	Issue/property/name search.	Root-cause investigation.

Rule

No KPI should be quoted without its date range. Scope is part of the number.

Live site - Calls module

Calls / Conversation Inbox module from deployed site

What this proves

- Calls are separated from Analytics in production.
- The inbox supports time filters, phone/keyword search and sort modes.
- Transcript detail tabs include Chat, SMS, Technical and Audio.

Calls module - conversation memory

Part	What it does	Why it matters
Calls lock	Protects call memory and customer issue history.	PII and transcript security.
Time range	Today, 7 days, 30 days, All, Custom.	Find calls in the right operational window.
Thread sorting	Recent, Relevant, Most interaction, Least interaction.	Triage by recency, risk or complexity.
Search	Phone number and keyword search.	Find a guest, property, issue or phrase.
Call list	Caller-level thread rows.	Keeps continuity across multiple calls.
Transcript panel	Conversation detail viewer.	Quality, audit and follow-up.
Detail tabs	Chat, SMS, Technical, Audio.	Separates human-readable transcript from system evidence.

Transcript detail tabs - what a supervisor checks

Tab	Likely content	Supervisor question
Chat	Guest and concierge transcript turns.	Was the answer accurate, concise and brand-safe?
SMS	Text actions to guest/advisor.	Did the agent send the promised durable follow-up?
Technical	Tool/system events and metadata.	Did the agent ground the response in Guesty/Twilio/SQLite?
Audio	Audio-related call artifacts when available.	Was there a voice quality or transcription issue?

Audit standard

A good call validates facts, sends useful SMS, avoids unsupported promises and escalates judgment calls.

Live site - Security module

Security settings module from deployed site

What this proves

- Security is protected by dashboard access.
- Controls reservation validation mode and human escalation numbers.
- Separates guest-facing service from admin-only risk settings.

Security module - controls and risk posture

Control	Observed live function	Risk controlled
Reservation validation	Code only, relaxed, strict.	How much proof is needed before stay details.
Emergency advisor SMS	Human issues notify a configured advisor line.	Operational exceptions do not stay with the bot.
VIP Reservations	Separate high-touch reservations line.	Premium/VIP pipeline gets human attention.
Current call rules	Use caller ID, confirm code/name, offer SMS, transfer on human request.	Operator-readable policy.

Live site - mobile voice console

Mobile live capture

What this proves

- The app is responsive.
- Voice controls, monitor and status copy remain accessible.
- Mobile view matters for operators testing from a phone-sized browser.

Live site - mobile analytics lock

Mobile Analytics module

What this proves

- Protected analytics remains clear on mobile.
- The lock copy explains why access is restricted.
- The module is copyable as a vertical dashboard pattern.

Front-end module map

Module	Primary user	Core responsibility
Voice Console	Operator / tester	Start/test voice, select voice, monitor Twilio and compose test instructions.
Analytics	Manager	Scorecard, priorities, charts, repeated issues and escalation reasons.
Calls	Supervisor	Caller memory, transcript review, SMS/tool/audio audit.
Security	Admin	Validation mode and human escalation contact controls.
Booking surfaces	Guest/prospect	Property inventory and public link routing.

Backend endpoint map

Endpoint family	Purpose	Visible front-end use
/session / realtime	OpenAI Realtime session and tool registration.	Voice testing and call flow.
/api/status	Configuration status and knowledge-base flags.	Server/Guesty/Twilio/Vapi readiness.
/api/twilio/monitor	Deep Twilio monitor for local dashboard.	Operations monitor.
/api/twilio/public-health	Public health endpoint.	Tunnel/Twilio reachability.
/api/calls/threads	Threaded call inbox + metrics.	Analytics and Calls modules.
/api/calls/thread	One caller history.	Transcript panel.
/api/*contact	Advisor and VIP phone settings.	Security module.

Tool architecture - agent action surface

Tool family	Functions	Control posture
Guesty status/search	guesty_status, guesty_search_reservation.	Read-only discovery.
Guesty confirmation	guesty_confirm_reservation, guesty_confirmed_stay_details.	Validation-gated sensitive data.
Guesty inventory	listings, available listings, listing calendar.	Read-only property facts.
Public links	glam_search_public_property_links.	Public SQLite only.
Twilio SMS	property link, stay details, human handoff.	Consent/context aware.
Twilio transfer	twilio_transfer_call_to_human.	Escalation path.

Core safety choice

Guesty writes, payments, refunds and policy exceptions are intentionally outside the autonomous tool surface.

Guesty as a live API tool

Use case	Guesty role	Agent behavior
Find reservation	Search by code, phone, email or name.	Handles noisy phone-call confirmation codes.
Confirm stay	Returns verified reservation/listing details.	Requires validation before sensitive details.
Check availability	Search listings by dates and guests.	Supports prospect calls.
Calendar/pricing	Listing calendar and nightly pricing.	Grounds booking discussion.
Missing fields	Diagnostics for access/Wi-Fi/custom fields.	Escalates when Guesty data is incomplete.

Twilio call and SMS synchronization

Flow	Mechanism	Why it matters
Inbound call	Twilio line routes to realtime bridge.	Turns phone call into AI conversation.
Media stream	Bridge carries audio to realtime agent.	Voice experience instead of text-only bot.
Property-link SMS	Agent texts public property link after consent.	Moves sales follow-up into durable channel.
Stay-details SMS	Agent texts verified arrival/access details.	Reduces repeat calls and confusion.
Human handoff SMS	Advisor receives reason and summary.	Escalation is actionable.
Live transfer	Active call can be transferred.	Guest can reach a human immediately.

Data architecture

Data asset	Role	Status
data/glam_homes_property_links.sqlite	Public property link lookup.	Integrity ok; 54 active records.
data/guesty-property-links.json	Portable public property export.	JSON valid.
data/private/guesty-conversations	Raw/private Guesty export and builders.	Private internal only.
GLAM HOMES KNOWLEDGE BASE	Use cases, playbooks, best practices.	24,072 structured cases.
transcripts	Local call transcripts.	Private; not GitHub-safe.
live-screenshots	Evidence used for this report.	Stored in Orbit report folder.

Knowledge base model

Layer	Purpose	Output
Raw export	Preserve original Guesty conversations.	Local private archive.
Filtering	Remove empty/noisy/low-value threads.	Cleaner corpus.
Case index	Structured JSONL cases.	24,072 rows, 0 invalid JSON.
Use cases	Cluster repeated guest patterns.	Training and review material.
Property playbooks	Property-specific recurring guidance.	Better per-home handling.
Runtime best practices	Compact instructions for active agent.	Loaded with knowledge_base_loaded=True.

Analytics computation model

Metric group	Source	Computation idea
Volume	Call summaries and Twilio metadata.	Count calls in selected time range.
Topics	Transcript text keyword categories.	Booking, support, handoff, events risk, payment.
Tool actions	Transcript event role/kind.	Count system-grounded actions.
Handoffs	human_handoff event kinds.	Escalation count and rate.
Repeat contact	Caller/thread grouping.	Repeat callers and same-subtopic repeats.
SMS	Twilio transcript/tool events.	Guest/advisor follow-through count.
Attention/praise	Conversation analysis fields in deployed UI.	Quality review queue.

Security and privacy model

Risk	Control	Evidence
PII exposure	Dashboard locks for analytics/calls/security.	Live lock screens.
Sensitive stay details	Reservation validation before details.	Guesty tool schemas and security module.
Unauthorized changes	Guesty read-only; no payment/refund writes.	Tool manifest and runtime tools.
Private corpora	data/private ignored/export-marked.	Export manifest.
Credential leakage	.env/API Keys kept private.	.gitignore and docs.
Bad automation	Human handoff and transfer tools.	Twilio handoff functions.

Deployment finding - live and local UI differ

Observation	Live deployed site	Local repo file
Tab model	Voice Console, Analytics, Calls, Security.	Voice Console, Calls & Analytics, Security.
Analytics depth	12 KPIs, priority grid, heatmap, subtopic/escalation tables.	Simpler KPI/chart set in current local file.
Security controls	VIP Reservations line present live.	Local file may not reflect that exact deployed split.
Implication	Production has evolved beyond local checked HTML.	Export should include live evidence and reconcile source before future deploys.

Recommendation

Before the next production release, pull/export the deployed front-end version or reconcile local source so GitHub is the single source of truth.

How a human should use the panel daily

Cadence	Review	Decision
Start day	Missed/abandoned, needs attention, priority queue.	Who needs callback or human follow-up?
Midday	Prospects, VIP pipeline, SMS sent.	Which booking opportunities need action?
End day	Top topics, subtopics, handoffs, repeat issues.	What data/process changed tomorrow?
Weekly	7-day call timing, FCR, repeat contact, escalation reasons.	Staffing and playbook improvements.
Monthly	30-day trends and knowledge-base update candidates.	Automation roadmap and client reporting.

Operational playbooks by scenario

Scenario	Agent/system path	Human rule
Prospect asks for villa	Search availability or public links; SMS property link.	Human only for discount or special deal.
Guest needs access	Confirm reservation; retrieve stay details; SMS details.	Human if missing data or lockout.
Policy exception	Explain policy; collect summary; handoff.	Human approves refunds, pets, events, late checkout.
Maintenance issue	Capture issue, urgency, reservation; advisor SMS.	Human coordinates service.
VIP/influencer	Flag pipeline and route to VIP number.	High-touch handling.

Risk matrix

Risk	Current mitigation	Next hardening step
Dashboard password reuse	Protected lock already exists.	Move to signed internal auth.
Local/deploy drift	Report documents discrepancy.	Make deployment artifact versioned.
Transcript privacy	Local/private boundaries documented.	Role-based access and retention policy.
Analytics false positives	Metrics are decision support.	Human labels and QA scorecards.
Tool overreach	Guesty read-only and SMS/handoff scoped.	Approval workflow before any write tool.
Unstaffed handoff	SMS/transfer tools exist.	Define SLA and schedule.

Roadmap - next engineering improvements

Initiative	Why	Priority
Reconcile deployed UI into repo	Removes source-of-truth ambiguity.	High
Signed admin auth	Hardens protected dashboard.	High
Property-level analytics	Find homes causing repeat issues.	High
Resolution labels	Make FCR and quality more reliable.	Medium
Conversion funnel	Connect calls to bookings.	Medium
Alerting	Notify spikes in lockouts, handoffs or VIP calls.	Medium
Retrieval-based KB	Use cases without prompt bloat.	Medium

Orbit / Ai People reusable pattern

Pattern	GLAM HOMES proof	Reusable vertical example
Live API tool	Guesty PMS.	CRM, EHR, dispatch, ERP.
Voice interface	Realtime phone concierge.	Call centers and service desks.
Durable action channel	Twilio SMS.	Email, SMS, WhatsApp, ticketing.
Protected dashboard	Analytics, calls, security.	Supervisor consoles.
Human escalation	Advisor SMS and transfer.	Operations handoff.
Conversation intelligence	24,072 case KB.	Vertical playbooks.

Executive recommendations

- Position GLAM HOMES as the flagship hospitality call-center reference, not merely a concierge UI.
- Show the live screenshots first when presenting the project; they prove the product is operational.
- Lead with the problem solved: missed calls, unsafe static answers, manual SMS follow-up, and lack of management visibility.
- Treat Guesty as the first Ai People vertical tool: a read-only PMS connector with strict safety gates.
- Use the Analytics and Calls modules as the demo of managerial value: what happened, why it happened, what to do next.
- Before public export, reconcile the deployed front-end source back into the repo to avoid version drift.

Board-level message

The defensible asset is the operating pattern: live API truth + voice + action channel + protected supervision.

Supporting screenshot - Guesty tool test

Existing QA evidence: Guesty tool test

What this proves

- Shows tool-level verification.
- Useful as appendix evidence.
- Complements live front-end screenshots.

Supporting screenshot - booking inventory

Public booking property inventory

What this proves

- Shows public property surface.
- Connects SQLite links to user-facing booking inventory.
- Supports property-link SMS use case.

Supporting screenshot - rendered booking page

What this proves

- Shows destination experience after SMS link.
- Important for prospect conversion workflow.
- Confirms links are not abstract data only.

Rendered public booking property page

Appendix - screenshot inventory

Artifact	Description	Source
01-live-voice-console-fullpage.png	Desktop live voice console.	Browser capture
02-live-analytics-locked-fullpage.png	Desktop live Analytics lock.	Browser capture
03-live-calls-locked-fullpage.png	Desktop live Calls lock/inbox.	Browser capture
04-live-security-locked-fullpage.png	Desktop live Security lock/settings.	Browser capture
06-live-mobile-voice-console-fullpage.png	Mobile voice console.	Browser capture
07-live-mobile-analytics-fullpage.png	Mobile Analytics lock.	Browser capture
08/09/10/11-live-*-viewport.png	Clear desktop viewport captures for PDF readability.	Browser capture
live-index.html	Downloaded deployed front-end HTML.	curl

Appendix - validation snapshot

Check	Result	Status
Live site	Loaded GLAM HOMES Concierge; screenshots captured.	OK
PDF generation	ReportLab build with live images.	OK
SQLite	PRAGMA integrity_check returned ok; 54/54 active properties.	OK
Knowledge base	case_index.jsonl: 24,072 rows, 0 invalid JSON.	OK
Runtime import	knowledge_base_loaded=True; Guesty/Twilio/Vapi configured after load_dotenv().	OK
JSON	Property links and Guesty tool manifest parse as valid JSON.	OK
Runtime behavior	No runtime code changed by this report generation.	OK

Appendix - export package

Path	Purpose	Privacy
orbit-aipeople/README.md	Entry point for Orbit/Ai People.	Safe
SKILL_CATALOG.md	Reusable skills list.	Safe
CONTROL_PANEL_ANALYTICS_GUIDE.md	Human guide for dashboard use.	Safe
tools/guesty/tool-manifest.json	Guesty tool contract.	Safe
reports/live-screenshots	Live visual evidence and deployed HTML.	Review before public sharing
data/private/guesty-conversations	Raw/private corpus and KB.	Private
transcripts/logs/.env/API Keys	Operational secrets/data.	Private

Final acceptance statement

- The report now uses real live screenshots from glamhomes.aipeople.app.
- Each front-end module is explained: Voice Console, Analytics, Calls and Security.
- Every visible analytics category is defined: KPIs, priority cards, charts, operational tables, concepts, filters and inbox controls.
- The report introduces the real business problem and why the system solves it.
- Engineering architecture is tied to code, APIs, data assets and runtime controls.
- A concrete deployment finding is documented: production UI is ahead of local front-end source in analytics separation/depth.
- No production runtime behavior was changed while producing this report.

Conclusion

GLAM HOMES is ready to be presented as a serious Orbit/Ai People reference implementation once the deployed UI is reconciled back into source control.
